The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PIB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SBRCA2a) within cardiomycytes. The peptide schered from mutant PLB, native PLB or antibody against cargo peptide schered from mutant PLB, native PLB or antibody against comminant negative inhibitor of PLB-SBRCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the contractility and reduces blood pressure this method is useful for the dysfunction. The present sequence is the penetratin-based recombinant peptide PLB-ANT, comprising the amino terminal end of human PLB native protein, attached to the 5' end of the Drosphila antennapedia (ANT) transport peptide. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plasma membrane

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA, 2, Ca2+ Arpase of the sarco/endoplasmic reticulum) appearing as ADE45167-ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises TYT-6, AZG-9 and/or AZG-13, an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-22 and/or Phe-25 associating with an S4 binding site of the phospholamban cytosolic domain when the compound is binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzyl-23,7-bis ((IH-tetra20-15-y1) methyloxy)-4-methyl-2H-methyl-2H-1-benzopyzan-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the CA2 + -ATPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA 2. The present sequence is the cytosolic domain of human phospholamban.
                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                Human; SERCA_2, phospholamban; PLB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Domain
                                                                                                                                                  The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (2 2 + ATPase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutation Val49Ala. This mutant sequence when contractility than the wild type PLB sequence
                                                                                                                                                                                                                                                                                            Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine

small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPERS (SERCAZA) within cardiomyores. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCAZA interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the dysfunction. The present amino acid sequence is the human PLB wild type apported. A potent inhibitor of SERCAZA acitivity. It primarily exists in a pentameric form. It is a mediactor in the regulation of myocardial function by catecholamines through the cAMP cascade
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses a method for the treatment of heart failure, using

(referred to as open reading frame, ORFX, where X is 1-11431 (see Table 1 in the specification). ABN18762 to ABN7252 encode the human ORFX proteins given in ABP00010 to ABP1500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a spondar associated with ORFX-associated disorder. ORFX polymorlecting a squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, infrared of interpretation, cardiovascular disorders, disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders, haemorrhage, catecathritis, neurodegenerative disorders, cholesterol ester transplantation, cardiovascular diseases, diabetes medilitus systemic transplantation, cardiovascular diseases, disorders, infectious storage disease, various immune deficiencies and disorders, infectious disease, uncommune thyroddris, mysathenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulces, for treating separative disorders, in creating or liver fibrosis, bone degenerative disorders, or protection or regeneration and treatment of lung or liver fibrosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; open reading frame; ORFX, gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertensison; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune thyroidis;

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA, 2, ADE4-1114 for, a phospholamban (PLB) protein (an inhibitor of SERCA, 2, ADE4-1173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site of the binding site of the binding site of the binding site of moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Arg-14, a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/Or Leu-28, and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-27 and/Or Leu-28, and a hydrophobic moiety associating with an S4 binding site of the phospholamban comprises the compound is not 3-benzyl-57-bis ((1H-tetrazol-5-yl)-methyloxyl-4 methyl-2H-methyl-2H-lenzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the cac 2 + -Arasas. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a

ATPRASE of the sarco/endoplasmic reticulum ) appearing as ADR45167-ADR45173. The compound has a tructure containing three of the four moietteles: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of mathyloxyl-4 methyl-2H-methyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-2H-nethyl-

The internation leaders to a compound within deactives, and stitute, for, a phospholamban (RLB) protein (an inhibitor of SERCA 2, and stitute, for, a phospholamban (RLB) protein (an inhibitor of SERCA 2, and stitute, for, a phospholamban creticulum) appearing as ADB45167-ADB4513. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-12 and/or Phe-13 and/or Phe-13 and/or Phe-13 and/or Phe-13 and/or Phe-14 bencyplain administrating the novel compound to stimulate the C2 2 + -ATPage. The compound is useful for relieving the inhibitory the contains and second are deactivating the contains and second and as a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a second and a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

phospholamban on stimulating Ca2+ New compound, useful for relieving inhibitory effects of cardiac SR Ca2+-ATPase by deactivating phospholamban and -ATPase.

Claim 1; SEQ ID NO 1; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA\_2, CAS-ATPRASE of the sarcofendoplasmic reticulum) appearing as ADB45167-ADB45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr.6, Arg-9 and/or Arg-13; an electronegative moiety associating with an SZ binding site of the phospholamban cytosolic domain when the compound is bound to it, the SZ binding site comprises Arg-14; a hydrophobic moiety associating with an SZ binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety

```
ö
associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32. and/or Phe-35. The compound is not 3-benzyl-5,7-bis ([H-tetrazol-5-yl])-methyloxyl-4-methyl-2H-methyl-2H-benzopyran-2-one. Also included are deactivating phospholamban, comprising administering the rowel compound to stimulate the Ca 2 + -ATPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                              Length 52;

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase

```
The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Arpase (SRRCA2a) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dystunction. The present sequence is the hexahistidite (H6) tagged penetratin-based recombinant protein H6-mutantPLB-ANY, comprising the turnsport peptide attached by a hexahistidine tag. This sequence is expressed in Escherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Corresponds to Human phospholamban (PLB) protein"

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PIB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 24 ATPaca (SERCA2A) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against CPLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure; This method is useful for the treatment of cardiac disease e.g. heart failure and mycoardial dysfunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-wPLB-ANT, comprising the wild type human PLB protein and Drosophila antennapedia (ANT) transport Escherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Phospholamban, PLB, human, sarcoplasmic reticulum Ca 2+ ATPase, SERCA2a, cardiant, cardiomycorpte, transport peptide, penetratin, cargo peptide, contractilin, cardiac contractility, inhibitor, cardiac disease, treatment, heart failure, myocardial dysfunction, mutant.
         Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Disclosure; Page 49; 56pp; English.

small peptide complexes and recombinant proteins, that induces the phospholamban (FB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (SERCA2a) within cardiomycycles. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a downmant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the mutanion SerIshan. This mutant sequence when overexpressed in the transformed cardiomycoytes, shows increased contractility than the wild type PLB sequence patent discloses a method for the treatment of heart failure, using

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase.

Claim 1; SEQ ID NO 2; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PL3) protein (an inhibitor of SERCA 2, Ca2+ ATPase of the sarco/endoplasmic reticulum ) appearing as ADE45167-

```
ADB45173. The compound has a structure containing three of the four moieties: an electromegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it the binding site comprises Tyre, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic compain when the compound is bound, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-S5. The compound is not 3-benzyl-57-bis ([1H-tetrazol-5-yl]-methyloxyl-4 methyl-2H-methyl-2H-1-benzopyran-2-one. Also included are deactivating chospholamban, comprising administering the novel compound to stimulate the Ca 2 + ArRese. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a

mail peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (a 2+ Arpase (SERCA2a) within cardiomycytes. The peptide complexes of transport peptide like penetratin and cargo peptide complex comprises of transport peptide like penetratin and cargo peptide complex comprises of transport peptide functions as a contractility and reduces blood pressure. This method is useful for the treatment of Cardiac disease e.g. heart failure and myocardial crafted rate and myocardial peptide TAT-mutant PLB, comprising the amino terminal end of human PLB mutant (Saridium) protein, attached to the 3' end of denatured human immunodeficiency virus (HTV), TAT protein Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; mutant; treatment; heart failure; myocardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia.
                                                                        The patent discloses a method for the treatment of heart failure, using

    20 /norresponds to mutant human phospholamban (PLB)
amino terminal peptide".

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
```

```
The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces on the phospholamban (PLB) deficiency and inhibits the interaction between PLB and sercoplasmic reticulum Ca 2+ Arpase (SERCA2A) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2A interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial for the dysfunction. The present sequence is the penetratin-based recombinant opeptide, mutant PLB-ANT, comprising the amino terminal end of human PLB wutant (SerI6Glu) protein, attached to the 5' end of the Drosophila antennapedia (ANT) transport peptide. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane
                                                                                                       Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                         Example 5; Page 53; 56pp; English.

Delivering a dose of a gene expression cassette in a fluid selectively to heart for sustained expression, useful for improving or enhancing cardiac function, by employing a viral vector together with a vascular permeablizing agent.

Example 6; Fig 1; 12pp; English

The invention relates to delivering a therapeutic dose of a gene expression cassette in a fluid selectively to heart for sustained expression, comprising employing a viral vector together with a vascular permeabilising agent. The method is useful for gene therapy delivering genes for improving or enhancing cardiac function, particularly in hamster models of heart disease. The present sequence is that of a pseudophosphorylation mutant of phospholamban (SIGEPLB). This point mutant is among a number of dominant negative mutants identified and characterised in WOOO/25804 and used in the method of the present invention

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase. 

Claim 1; SEQ ID NO 7; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, Ca2+ ATPage of the sarco/endoplasmic reticulum ) appearing as ADB45167-ADB45173. The compound has a structure containing these of the four molecies: an electronegative molecy associating with an S1 binding site

```
of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an $2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the $2 binding site comprises Arg-14; a hydrophobic moiety associating with an $3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety associating with an $3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-benzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + -Arpsase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phospholamban; PLB; human, sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a, cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractility; inhibitor; cardiac disease; mutant; transment; heart failure; myccardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia; H6 tag; hexahistidine.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 24 ATPaca (SERCACA) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against DLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCACA interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial cysfunction. The present sequence is the hexabisticine (H6) tagged penetratin-based recombinant protein H6-mutantPLB-NNT, comprising the human mutant (SerlGGlu) PLB protein and Drosophila antennapedia (ANT) expressed in Escherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomycoytre; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
                             Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chien.K, Dillman W, Minamisawa S, He H, Hoshijima M, Meyer M;

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase

Disclosure, Page 48-49; 56pp; English.

small peptide complexes and recombinant proteins, that induces by phospholamban (PB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum G2 + ArBase (SBRCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide sclerced from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SBRCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein. comprising a sense mutafich Argiddium, ownershing and myocardial overexpressed in the transformed cardiomyocytes, shows increased contractility than the wild type PLB sequence The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction

```
small peptide complexes and recombinant proteins, that induces the phospholauban (PbB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca + ATPase (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, mative PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the mutation Glu2Ala. This mutant sequence when contractility than the wild type PLB sequence
                                                                                                                                                                        The patent discloses a method for the treatment of heart failure, using
comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.
                                                                                                                        Disclosure, Page 48; 56pp; English.

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction

comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine riphosphatase.

Disclosure; Page 49; 56pp; English.

small peptide complexes and recombinant proteins, that induces the phospholamban (PDB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Cat ATPASS (SERCAS) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin) Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2 interaction, enhances cardiac confractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein. Comprising the double mutation Lysallu and Argisclu. This mutant sequence, when overexpressed in the transformed cardiomycoytes, shows increased contractility than the wild type PLB sequence patent discloses a method for the treatment of heart failure, using

Novel antifungal protein FCWP1, isolated from Fusarium culmorum, useful for controlling fungal infections in plants. WPI; 2003-754558/71.

Example 21; SEQ ID NO 181; 27pp; English.

The invention relates to an isolated antifungal ribosomal protein from

custium culmorum, FCWP1. Also included is a fusion protein between the signal peptide of the antifungal protein AlyAPP From AlySama and FCWP1, concoded by the nucleic acid appearing as ADC87758. The FCWP1 proteins are useful for controlling fungal infections in plants, such as those caused by Alternaria (e.g. Ascochyra pisi). Botrytis (e.g. Botrytis cinera), accompyra (e.g. Ascochyra pisi), botrytis (e.g. Botrytis cinera), collectrichum (e.g. Ascochyra pisi). Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 19332, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION
FOR A PARTICULAR

APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: APPLICATION NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
                                                      Patent No. 6610836
GENERAL INFORMATION
FATTLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUMBER: US/09/489, 039A
CURRENT APPLICATION NUMBER: US/09/489, 039A
CURRENT APPLICATION NUMBER: US 60/117,747
PRIOR APPLICATION NUMBER: US 60/117,747
PRIOR FILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
LENGTH: 98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GENERAL INFORMATION:

APPLICANT: Gary Breton et. al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA

TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

FILE REFERENCE: 2709.2004001

CURRENT APPLICATION NUMBER: US/09/489,039A

C;Comment: Phospholamban is the major phospholated and the rate of muscle sarcoplasm
C;Keywords: acetylated anno end; ATPase inhibitor; muscle; pentamer; phosphorein; transmembrane #status predicted
F;17/Binding site: phosphate (Firl) (covalent) (by calmodulin-dependent kinase) #status predicted
F;17/Binding site: phosphate (Thr) (covalent) (by calmodulin-dependent kinase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     phospholamban - rabbit

probable exported protein STY4756 [imported] - Salmonella enterica subsp. enterica serovary probable exported protein STY4756 [imported] - Salmonella enterica subsp. enterica serovar Typhi
Gispecies: Salmonella enterica subsp. enterica serovar Typhi
Gispecies is also been called Salmonella typhi
Gispecies 19-Nov-2001 #sequence_revision 09-Nov-2001 #text_change 18-Nov-2002
Giscession: AH1053
Gispecies is revision 09-Nov-2001 #text_change 18-Nov-2002
Gispecies is revision Gispecies K.D.; Thomson, N.R.; Pickard, D.; Wain, J.; Churcher, th. T.; Connerton, P.; Cronin, A.; Davis, P.; Davies, R.M.; Dowd, L.; White, N.; Farrar, S.; Moule, S.; O'Gaora, P.
Nature 413, 848-852, 2001

Nahlernate names: protein F20188.190
C)Alternate names: protein F20188.190
C)Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 30-Apr-1599 #sequence_revision 30-Apr-1599 #text_change 08-Oct-1999
C;Accession: T04263; As588
C;Accession: T04263, As588
Submitted to the Protein Sequence Database, March 1999
A;Reference number: 215263

"Using experimental information to produce a model of the transmembrane domain of the ion channel phospholamban.";

Blophys. J. 74:1203-1214 (1998).

-! PUNCTION: Phospholamban has been postulated to regulate the activity of the calcium pump of cardiac sarcoplasmic reticulum.
-! SUBGNIT: Homopentamer.
-! SUBGNIT: Homopentamer.
-! TISSUE SPECIFICITY: Heart.
-! TISSUE SPECIFICITY: Heart.
-! PTM: Phosphorylated in response to beta-adrenergic stimulation.
-! SIMILARITY: Belongs to the phospholamban family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rattus norvegious (Rat), and

Circ. Res. 71:1021-1030(1992).
-!- FUNCTION: Phospholamban has been postulated to regulate the activity of the calcium pump of cardiac sarcoplasmic reticulum. activity of the membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- SUBCELLULAR LOCATION: Membrane.
-!- TISSUB SPECIFICITY: Heart.
-!- FTM: Phosphorylated in response to beta-adrenergic stimulation.
-!- SIMILARITY: Belongs to the phospholamban family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Shanahan C.M., Weissberg P.L., Metcalfe J.C.;

Nat. Biotechnol. 21:526-531(2003)

-!-FUNCTION: This protein is located at the 30S-50S ribosomal subunit interface and may play a role in the structure and function of the aminoacyl-CRNA binding site (By similarity).

-!-SIMILARITY: Belongs to the L19P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SPECIES S. Submitted (FEB-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This protein is located at the 30S-50S ribosomal subunit interface and may play a role in the structure and function of the aminoacyl-tRNA binding site (By similarity).
-!- SIMILARITY: Belongs to the L19P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.
